

Education Loan Assessment Tool

Hiring Assignment

Background

GradGuide helps students plan their study abroad journey, including education financing. We want to build a simple tool that helps a student or counsellor understand the student's financial position and potential education-loan requirement.

The Assignment

Build an Education Loan Assessment Tool where a student/counsellor can enter study details, upload financial documents, and receive a clear assessment.

- Calculate the approximate total study cost and loan requirement.
- Capture income, assets, liabilities and net worth from the information provided.
- Allow relevant documents such as ITRs and CA Net Worth Certificates to be uploaded.
- Assess available collateral and whether a collateral or non-collateral route may be relevant.
- Use the lender database provided with the assignment to identify relevant lender criteria.

What the Tool Should Cover

Area	Examples
Study	Country, university, course, tuition, living costs
Funding	Savings, scholarship, fees paid, family contribution
Financial profile	Income, ITRs, assets, liabilities, net worth
Collateral	Property / other assets and available value
Documents	ITR, bank statement, salary slips, CA net worth, property documents
Loan assessment	Funding gap, collateral/non-collateral route, relevant lender criteria

Your 3 Original Features

Choose and build three features of your own. We are intentionally not giving you a list of suggested features. We want to see what problems you identify and how you choose to solve them.

For each feature, briefly explain: what problem it solves, why it matters, and how your solution works.

Lender Database

Lender Database:

https://docs.google.com/document/d/17NylZxq7mtm_lfiW2HoAWUepetSCKJOQ5pWAp8e8Pc/edit?usp=sharing

Use it as the source of truth for the lender information supplied with the assignment. Your application should use this data rather than hard-coding lender rules throughout the code.

The reference data includes lender interest rates, CIBIL requirements and document requirements for collateral and non-collateral loans.

Deliverables

- Working application – hosted link or run instructions.
- Source code – GitHub repository.
- Short write-up – explain your approach and your three feature decisions.
- Short video walkthrough – add it to the GitHub README.

What We Will Evaluate

- Accuracy of the financial calculations and assessment.
- How well the product handles the supplied lender data.
- Quality and usefulness of the three original features.
- Usability and clarity.
- Code quality and ability to explain your decisions.

Note: The tool is an assessment/decision-support product and should not claim to guarantee loan approval or rejection.
